

Project Work on
“Pizza Chatbot Development”

Using
Azure QnA Maker Service

Submitted by
Sasidhara Kashyap Chaturvedula
2nd year B. Tech, GRIET, Hyderabad

Submitted to
Future Ready Talent

Objective

In this project, I would be using QnA Maker service to make a Chatbot that orders your favourite fast food like Pizzas, Cakes, Ice Creams, Garlic Bread, etc.

Problem Statement

Develop a chatbot for **Pizza** which greets the customer and provides the menu to choose from the given menu and it should also mention the parcel services will be soon coming.

Problem Context

The purpose of chat bots is to support and scale business teams in their relations with customers. It could live in any major chat applications like Facebook Messenger, Slack, Telegram, Text Messages, etc. Chatbot applications streamline interactions between people and services, enhancing customer experience. At the same time, they offer companies new opportunities to improve the customers engagement process and operational efficiency by reducing the typical cost of customer service. This project is focussed on building a custom chatbot that will be your fundamental step of the learning curve of building your own professional chatbots. But you must be tired of the weird chat bots out there in the world which are made for business purposes? In this project, we would be building an extensive Chatbot service, to which you can talk. And talking to a chatbot would not be business driven. It would just be casual conversations. Collaborating with these types of APIs is very much critical as in today's world the popular chatbots do much more than simply having a data-driven conversation; to supplement additional user-oriented features.

What is an Azure QnA Maker service?

QnA Maker is a cloud-based Natural Language Processing (NLP) service that allows you to create a natural conversational layer over your data. It is used to find the most appropriate answer for any input from your custom knowledge base (KB) of information.

QnA Maker is commonly used to build conversational client applications, which include social media applications, chat bots, and speech-enabled desktop applications.

QnA Maker does not store customer data. All customer data (question answers and chat logs) is stored in the region the customer deploys the dependent service instances in. For more details on dependent services see [here](#).

This documentation contains the following article types:

- The [quickstarts](#) are step-by-step instructions that let you make calls to the service and get results in a short period of time.
- The [how-to guides](#) contain instructions for using the service in more specific or customized ways.
- The [conceptual articles](#) provide in-depth explanations of the service's functionality and features.
- **Tutorials** are longer guides that show you how to use the service as a component in broader business solutions.

When to use QnA Maker

- **When you have static information** - Use QnA Maker when you have static information in your knowledge base of answers. This knowledge base is custom to your needs, which you've built with documents such as [PDFs and URLs](#).

- **When you want to provide the same answer to a request, question, or command** - when different users submit the same question, the same answer is returned.
- **When you want to filter static information based on meta-information** - add [metadata](#) tags to provide additional filtering options relevant to your client application's users and the information. Common metadata information includes [chit-chat](#), content type or format, content purpose, and content freshness.
- **When you want to manage a bot conversation that includes static information** - your knowledge base takes a user's conversational text or command and answers it. If the answer is part of a pre-determined conversation flow, represented in your knowledge base with [multi-turn context](#), the bot can easily provide this flow.

What is a Knowledge Base?

QnA Maker [imports your content](#) into a knowledge base of question-and-answer pairs. The import process extracts information about the relationship between the parts of your structured and semi-structured content to imply relationships between the question-and-answer pairs. You can edit these question-and-answer pairs or add new pairs.

The content of the question-and-answer pair includes:

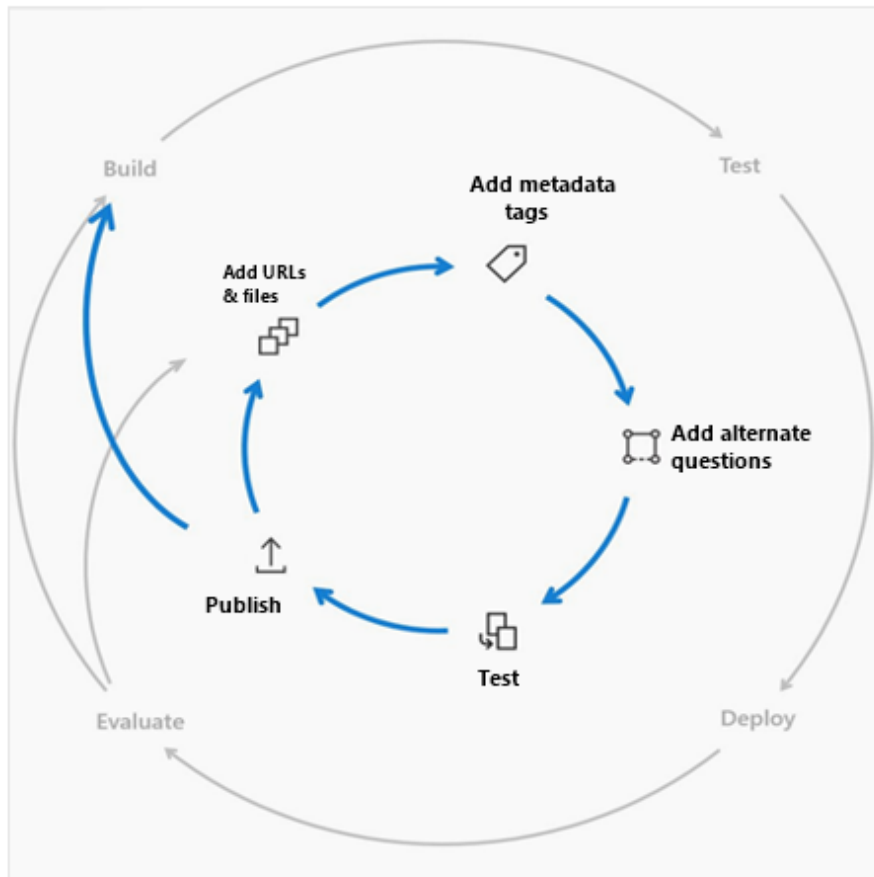

- All the alternate forms of the question
- Metadata tags used to filter answer choices during the search
- Follow-up prompts to continue the search refinement

| Question | Answer | Metadata tags ? |
|--|---|------------------------|
| Original source: https://docs.microsoft.com/en-us/azure/cognitive-services/qnamaker/faqs | | |
| I accidentally deleted a part of my QnA Maker, what should I do? | All deletes are permanent, including question and answer pairs, files, URLs, custom questions and answers, knowledge bases, or Azure resources. Make sure you export your knowledge base from the **Settings** page before deleting any part of your knowledge base. | Type : troubleshooting |
| Can I undo deleted questions and answers? | | Format : text-only |
| | | Nextstep : recover |

After you publish your knowledge base, a client application sends a user's question to your endpoint. Your QnA Maker service processes the question and responds with the best answer.

Azure QnA Maker Development Cycle

QnA Maker provides authoring, training, and publishing along with collaboration permissions to integrate into the full development life cycle.

Primary Goals

- ✓ Setting up a chatbot that can order your requirements (Pizza, Cakes, Ice creams...).
- ✓ Using a QnA Maker Bot service to build **Pizza** ordering chatbot.
- ✓ Having a real-world chatbot, to which you can chat like you chatting to a real person and ordering Pizza, Cakes...

Input

Below are the few training phrases for validating the bot:

Intents: Training Phrases

greetings: Hello

showMenu: Can you please show me the menu of your restaurant?

itemCost: How much does Pizza Mania cost?

orderStatus: When will I get my order?

provideParcel: Do you provide parcels now?

Output

Hello.

Hello

Just now

show me the menu

3 minutes ago

Dominos's Menu

1. Pineapple Pizza 20\$
2. Cheese Burger Pizza 50\$
3. Cheese Paneer Pizza 75\$
4. Margherita 100\$
5. Tomato Paneer Pizza 75\$

Icecreams 50\$

1. Vanilla
2. Butterscotch
3. Chocolate
4. Strawberry
5. Mango

- Cakes 50\$**
1. Chocolate Cake
 2. Strawberry Cake

Garlic Bread 75\$

Pizza Mania 200\$

1. Tomato
2. Onions
3. Panner
4. Golden Corn
5. Pineapple

How much does Pizza Mania cost?

Just now

Its costs 200 US Dollars and we don't have any discount price on this item at this time.

When will I get my order?

Just now

You will be getting your order within 45 mins after your payment to any item on this menu.

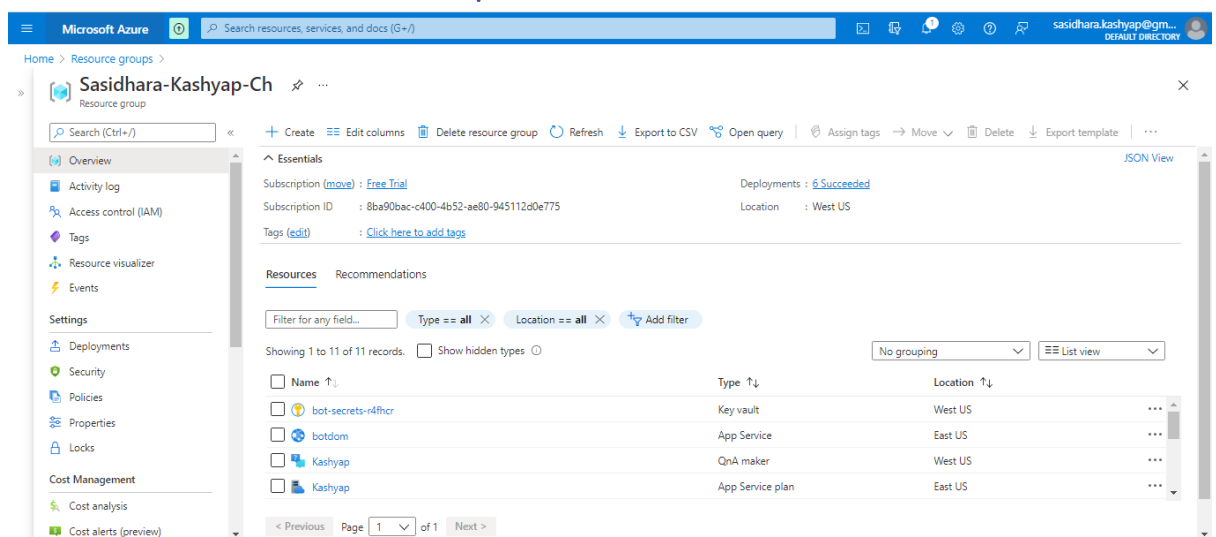

Process

README.md file given in GitHub has the required information and some of the screenshots below.

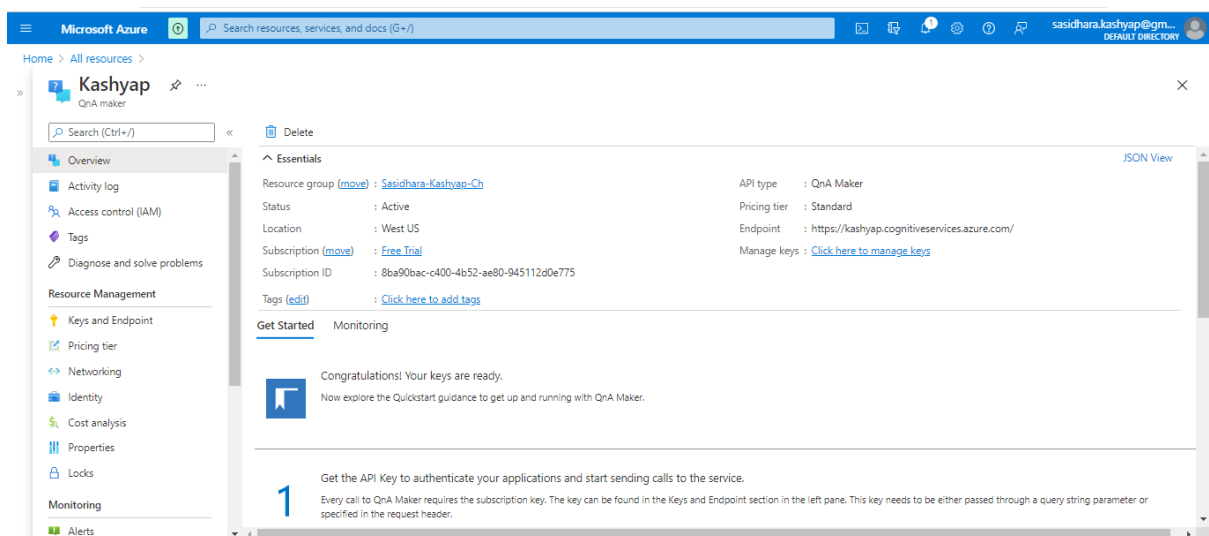

Task 1

✓ Create a Resource Group on Azure

Task 2

✓ Create a QnA Maker Service on Azure

Task 3

✓ Create a Knowledge Base on Azure

The screenshot shows the Azure Bot Studio interface for a bot named 'Dominos-Pizza-Bot (Publisher)'. The top navigation bar includes 'EDIT', 'PUBLISH', 'SETTINGS', 'Save and train', and 'Test'. The main area is titled 'Knowledge base' and contains a search bar with '94 QnA pairs'. Below the search bar, there's a toggle for 'Enable rich editor' and a pagination control showing '1' of 10 items. The main content area displays a list of QnA pairs. The first pair is: Question: 'Do you provide parcels now?' Answer: 'There is NO parcels facility in this restaurant. We are bringing this parcels facility to our restaurant soon. Have a Good Day, please visit again to our restaurant.' The second pair is: Question: 'When will I get my order?' Answer: 'You will be getting your order within 45 mins after your payment to any'.

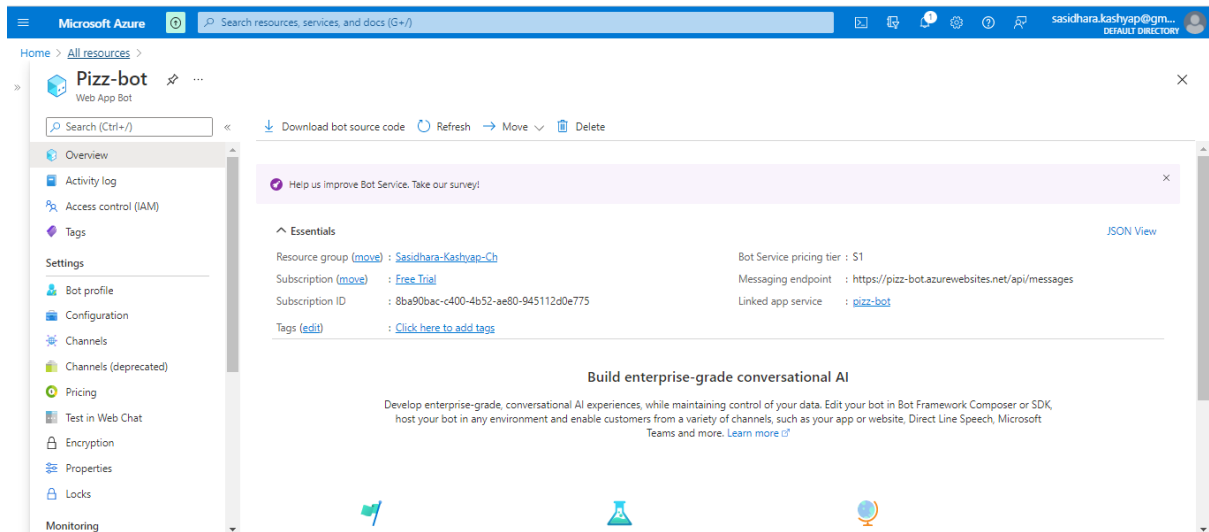

Task 4

✓ Create an App Service on Azure

The screenshot shows the Microsoft Azure portal interface for an App Service named 'pizz-bot'. The left sidebar contains navigation options: Overview, Activity log, Access control (IAM), Tags, Diagnose and solve problems, Security, Events (preview), Deployment, Quickstart, Deployment slots, Deployment Center, Settings, Configuration, Authentication, and Application Insights. The main area displays the 'Essentials' section for the App Service. Key details include: Resource group: Sasidhara-Kashyap-Ch, Status: Running, Location: East US, Subscription: Free Trial, Subscription ID: 8ba90bac-c400-4b52-ae80-945112d0e775, URL: https://pizz-bot.azurewebsites.net, Health Check: Not Configured, App Service Plan: Kashyap (S1:1), FTP/deployment username: No FTP/deployment user set, FTP hostname: ftp://waws-prod-blu-269.azurewebsites.windows.net/site/..., and FTPS hostname: ftps://waws-prod-blu-269.azurewebsites.windows.net/site/... Below the Essentials section, there are three cards: 'Diagnose and solve problems', 'Application Insights', and 'App Service Advisor'. At the bottom, there are three charts: 'Http 5xx' (showing 100), 'Data In' (showing 7kB), and 'Data Out' (showing 4kB and 3.5kB).

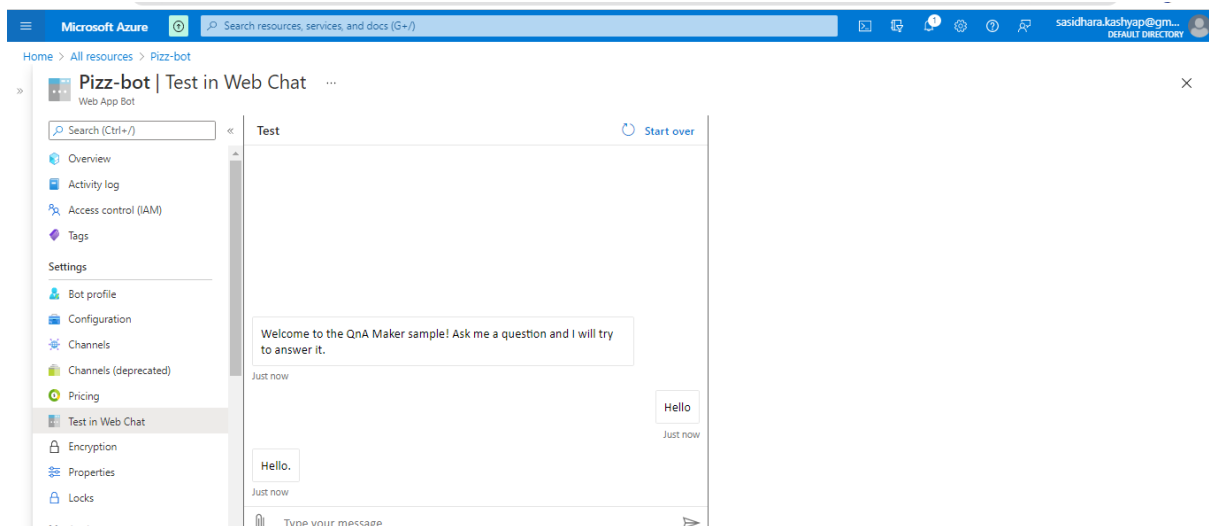

Task 5

✓ Create a Web App Bot on Azure

Task 6

✓ Testing my Bot on Azure

Microsoft Azure | Search resources, services, and docs (G+)

Expected Outcome

By the end of this milestone, you would be having a working chatbot system that orders your favourite food like Pizzas, Cakes, Ice Creams and Garlic Bread to the user along with chatting.

My sincere thanks, to Microsoft for an impressive QnA Maker service on MS Azure Cloud to make the chatbot development easy. It was a wonderful experience learning this and would like to explore more in next two years of my B.Tech. Sincere appreciation to Team of Future Ready Talent who supported and encouraged us to work on this project.
